                                                                                                                                                                                                                                                Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                             473 gggacggcaaagggctgacgagggtgcgtatgcccagcttgtgcttgtcagcgtaaagt 532

Put 1970 By The Cours of the Marker of Both Course, the Marker of Both State of this BAC-end sequence was carried out as part of a collaboration of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; no bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           potato.

//ore="Vector: pHOS1; Site_l: Bst I; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond (Clark,
                    Horvath (Laboratory of Plant Breeding, Dept. of Plant Sciences, Wageningen University, The Netherlands). Total RNA was isolated from developing axillary buds of potato modal stem cuttings cultured on medium for the introduction of tuber formation as described in Bachem et al. (Plant Journal 1996). Tissue samples were taken of stages corresponding to growing stolons and the early stages of tuber formation."
                                                                                                                                                                                                                                                                                                                                                                  ó

C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith. H.O. and Venter. J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /db_xref="taxon:5759"

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Ecogn digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's pl and BST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

This invention describes novel Gram positive bacterial hydrolases, namely YUXL, YTMA, YITW, TOKD, YCLE, YTAP, YDEN, YBFK, YFHM, YDJP, YVFQ, YVAM, YQJL, SRFAD, YCGS, YTPA, YBAC, YUII, YODD, YJCH and YODH. The encoding nucleic acid and its fragments, are useful as probes to detect foram-positive hydrolases. The gram-positive microorganisms are used to produce recombinant hydrolases which are useful in cleaning (e.g. detecragent) or textile treatment compositions, and in animal feeds. Other uses include peptide hydrolysis, waste treatment and cleavage of fusion proteins.

657 AA; Sequence

This polypeptide comprises serine protease SP1 (YUXL) of Bacillus SUbtilis.

Casubtilis. Novel serine proteases SP1, SP2, SP3, SP4 and SP5 (see Subtilis. Novel serine proteases SP1, SP2, SP3, SP4 and SP5 (see Camporation of Bacillus subtilis and SP3) were identified via a PASTA search of Bacillus subtilis accounts outcleic acid sequences. SP1 was identified by its second noutcleic acid sequences. SP1 was identified by its structural homology to the SP1 type serine protease dap2 of yeast. SP2, SP3, SP4 and SP5 were identified by their structural and corturing gene encoding one or more of SP1, SP2, SP3, CP4 or SP5 (see AAX07301-04) is mutated such that the proteolytic activity is diminished or deleted, can be used for the proteolytic of heterologous proteins, e.g. a hormone, enzyme, growth factor, cytokine, protease, carbohydrase, lipase, racemase, epimerase, catumed of the produced on a large scale of a microbial host expression system for use in cleaning compositions such as detergents, bar or liquid soap, dish-care compositions and contact lens cleaning solutions, as for peptide of patching and contact lens cleaning solutions, as animal feed of the production, and as animal feed of subtiliary animal feed of the production, and as animal feed of subtiliary and subtiliary and solutions and animal feed of the production, and as animal feed of the subtiliary and subtiliary and solutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    181 MKELTSHKADHGDPAFSPDGKWLVFSANLTETDDASKPHDVYIMSLESGDLKQVTPHRGS 240

The present sequence represents a Pyrococcus horikoshi acylpeptide hydrolase. The enzyme has the following properties: (a) it hydrolyses an acylpeptide; (b) an optimum temperature of 90.95 degrees Centigrade; (c) an optimum pH of 5.0-6.0; (d) no loss of activity when heated to 95 degrees Centigrade for 3 hours at pH 7.5; and (e) a molecular weight of 60 kDa. The enzyme is claimed useful for hydrolysing the amino end of an acylated protein and a peptide at high temperatures.

                                                                                                                                                                        Nucleic acid encoding heat-stable amidase from Thermococcus GU5L5 -useful for removing N-terminal amino acids from synthetic peptide(s) \,
                                                                                                                                                                                                                                                                                                           archaebacterium Thermocccus GU5L5. Its amino acid sequence was acchaebacterium Thermocccus GU5L5. Its amino acid sequence was deduced from an isolated nucleic acid (see ANV1288T). Recombinant amidase can be produced in transformed host cells, especially prokaryotic cells. The amidase is used to remove Arg, Phe or Met from the N-terminus of synthetic peptides or peptidonimetics (claimed). Removal of the N-terminal residue can be done even in the presence of a more reactive ester bond (very difficult to achieve non-enzymatically). The amidase is selective for L-amino acids and can therefore be used to produce optically active compounds. The protein tolerates temperatures up to at least 70 degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degc and high concentrations of organic solvent (e.g. over 40% degrees).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17.9%; Score 625; DB 19; Length 622; 29.1%; Pred. The present sequence represents a H3 homologue of a prolyl tripeptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidyl-peptidase has an amidolythic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prolyl tripeptidyl-peptidase, active analog, fragment or variant useful for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis

                                                                                                      The present sequence represents a H2 homologue of a prolyl tripeptidyl-peptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidyl-peptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group and of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for periodontal disease such as gingivitis and periodontitis caused by
for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis \dot{}

Recombinant acyl-peptide hydrolase -used to catalyse hydrolysis of N-acyl peptide(s) or reaction of N-acetyl amino acid donor and acceptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence contains the claimed sequence of acyl-peptide hydrolase (APH) (claim 1, page 11). APH can be used to catalyse the hydrolysis of the N-terminal acyl amino acid of an acylated polypeptide, or the reaction between a derivatised N alpha-acetyl amino acid donor and acceptor with a free alpha-NH2. It can also be used to make refractory proteins susceptible to Edman sequencing or th reduce degradation of proteins to
                                                                                                                                                                                                                                                                                                                                                                                                                                    /note="potential site of glycosylation"
                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="potential site of glycosylation"

The clones, lambda AARE 419, 450, 451, 452, 521 and 522 cover the entire sequence of the gene.

A positive clone was analysed and sequenced.

tripeptidy1-peptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidy1-peptidase (has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an amimal from a periodontal disease such as gingivitis and periodontitis caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             prolyl tripeptidyl-peptidase, active analog, fragment or variant useful

Schlossman S, Tanaka T; Morimoto C,

WPI; 1994-151317/18.

acid - useful for stimulating immune response, e.g. for treatment of AIDS to counteract immunosuppressive drug, and as vaccine Polypeptide fragments and analogues of CD26 and encoding nucleic adjuvant.

Claim 3; Page 49-52; 85pp; English.

The sequences given in AARS4612-14 represents analogues of the human T analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or responsestimulating therapeutics, eg. they may be used for treatment of AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs.
